this book addresses the complexity of russian verbal prefixation system that has been extensively studied but yet not explained traditionally different meanings have been

investigated and listed in the dictionaries and grammars and more recently linguists attempted to unify various prefix usages under more general descriptions the existent semantic approaches however do not aim to use semantic representations in order to account for the problems of prefix stacking and aspect determination this task has been so far undertaken by syntactic approaches to prefixation that divide verbal prefixes in classes and limit complex verb formation by restricting structural positions available for the members of each class i show that these approaches have two major drawbacks the implicit prediction of the non existence of complex biaspectual verbs and the absence of uniformly accepted formal criteria for the underlying prefix classification in this book the reader can find an implementable formal semantic approach to prefixation that covers five prefixes *za na po pere* and *do* it is shown how to predict the existence semantics and aspect of a given complex verb with the help of the combination of an ltag and frame semantics the task of identifying the possible affix combinations is distributed between three modules syntax which is kept simple only basic structural assumptions frame semantics which ensures that the constraints are respected and pragmatics which rules out some prefixed verbs and restricts the range of available interpretations for the purpose of the evaluation of the theory an implementation of the proposed analysis for a grammar fragment using a metagrammar description is provided it is shown that the proposed analysis delivers more accurate and complete predictions with respect to the existence of complex verbs than the most precise syntactic account

the topic of using views to answer queries has been popular for a few decades now as it cuts across domains such as query optimization information integration data warehousing website design and recently database as a service and data placement in cloud systems this book assembles foundational work on answering queries using views in a self contained manner with an effort to choose material that constitutes the backbone of the research it presents efficient algorithms and covers the following problems query containment rewriting queries using views in various logical languages equivalent rewritings and maximally contained rewritings and computing certain answers in the data integration and data exchange settings query languages that are considered are fragments of sql in particular select project join queries also called conjunctive queries with or without arithmetic comparisons or negation and aggregate sql queries this second edition includes two new chapters that refer to tree like data and respective query languages chapter 8 presents the data model for xml documents and the xpath query language and chapter 9 provides a theoretical presentation of tree like data model and query language where the tuples of a relation share a tree structured schema for that relation and the query language is a dialect of sql with evaluation techniques appropriately modified to fit the richer schema
